

FINAL PROJECT WRITE-UP

INTRODUCTION TO PROGRAMMING LOGIC

The group worked well together. Everyone participated in the game's approach and in fixing issues that we were having.

Ron selected the images and helped organize our group approach to the project.

Saul was obliging during the project. He did the “numOfMisses” counter and helped with some issues that we were having.

Wesley was very helpful. He created the Deck class, the shuffle function, and he helped with assigning variables and image sources, creating the for loop, differentiating the first click from the second click, and all the “if checking” to see if the person got the cards right or not.

I helped to organize our group approach to the project. I created the sleep function, the enable and disable cursor functions, and helped to create variables, assign image sources, all the “if checking”, and the general functioning of the code.

In conclusion, the group was very helpful and obliging all along, but I ended up contributing the most, followed by Wesley, Ron, and Saul.
